

# Random numbers

- see the `random` module for details and extent of creating random numbers

# Random numbers

- the method `random.randint` can be used to generate random integers
- any easy example usage is:

```
#!/usr/bin/env python3

import random

print ("your die roll was", random.randint (1, 6))
```

# Sounds

```
#!/usr/bin/env python3

sound = pygame.mixer.Sound ("mysound.wav")
sound.play ()
```

please see the [pygame](https://www.pygame.org/docs/ref/mixer.html) web site for more detail

## Adding Cities to your game

- the tutorial asked you to add cities and guns to your program

- ```
class city:
    def __init__ (self, pos):
        self._pos = pos
        self._epicenter = [pos[0] + int (city_length/2), pos[1]-city_height]
        self._exploding = False
        self._explosion = None
        self.draw_city ()
```

## Adding Cities to your game

```
def draw_city (self):
    pygame.draw.rect (screen, wood_light, (self._pos[0], self._pos[1], city_length, city_height))
def update (self):
    pass
def ignite (self, p):
    return self._exploding
def erase (self):
    pygame.draw.rect (screen, black, (self._pos[0], self._pos[1], city_length, city_height))
```

## Adding Cities to your game

```
def check (self, p, radius):  
    if (not self._exploding) and sqr (radius) > sqr (p[0]- self._epicenter[0]) + sq  
        self._exploding = True  
        createExplosion (p, grey)  
        createExplosion (self._epicenter, light_grey)  
        globalRemove (self)
```

## Using cities in your code

```
city_list = []
city_length = 90
city_height = 25
attack_number = 5
rate_of_attack = 400

def make_cities ():
    global city_list

    for p in [[100, 768-city_height], [200, 768-city_height], [300, 768-city_height],
              [600, 768-city_height], [700, 768-city_height], [800, 768-city_height]]:
        c = city (p)
        city_list += [c]
```

## Using cities in your code

```
def check_cities_guns (pos, radius):  
    for c in city_list:  
        c.check (pos, radius)
```

## Using cities in your code

```
def spawn_attack ():
    global attack_number
    if attack_number > 0:
        if random.randint (1, rate_of_attack) == 1:
            attack_number -= 1
            c = city_list [random.randint (0, 5)]
            createMissile ([random.randint (1, 1000), 0],
                           c._epicenter)
```

## Using cities in your code

```
def no_of_cities ():  
    n = 0  
    for c in city_list:  
        if not c._exploding:  
            n += 1  
    return n
```

## Using cities in your code

```
def check_finished ():
    if attack_number == 0 and len (allObjects) == 0:
        n = no_of_cities ()
        if n == 0:
            print ("you lost!")
        elif n == 1:
            print ("you survived with 1 city left")
        else:
            print ("you survived with", n, "cities left")
    sys.exit (0)
```

## Using cities in your code

```
def main ():  
    global screen  
    pygame.init ()  
    screen = pygame.display.set_mode ([width, height])  
    make_cities ()  
    wait_for_event ()
```

# Guns

- guns in missile command are rather similar to cities
- we need another class, with similar methods
  - it might be possible to inherit code - but that is left for another day

```
ammo_per_silo = 20  
gun_length = 90  
gun_height = 25  
gun_list = []
```

# Guns

```
class gun:
    def __init__ (self, pos):
        global screen
        self._ammo = ammo_per_silo
        self._pos = pos
        self._epicenter = [pos[0] + int (gun_length/2), pos[1]-gun_height]
        self._exploding = False
        self._explosion = None
        self.draw_gun ()
```

# Guns

```
def draw_gun (self):  
    global screen  
    print ("rect", self._pos, gun_length, gun_height)  
    pygame.draw.rect (screen, dark_blue, (self._pos[0], self._pos[1], gun_length, g  
def fire (self):  
    if self._ammo > 0 and (not self._exploding):  
        self._ammo -= 1  
        createMissile (self._epicenter, pygame.mouse.get_pos ())
```

# Guns

```
def update (self):  
    pass  
def ignite (self, p):  
    return self._exploding  
def erase (self):  
    pygame.draw.rect (screen, black, (self._pos[0], self._pos[1], gun_length, gun_h  
def check (self, p, radius):  
    if (not self._exploding) and sqr (radius) > sqr (p[0]- self._epicenter[0]) + sq  
        self._exploding = True  
        createExplosion (p, grey)  
        createExplosion (self._epicenter, light_grey)  
        globalRemove (self)
```

## Linking up guns to the game

```
def check_cities_guns (pos, radius):  
    for c in city_list:  
        c.check (pos, radius)  
    for g in gun_list:  
        g.check (pos, radius)
```

## Linking up guns to the game

```
def spawn_attack ():  
    global attack_number  
    if attack_number > 0:  
        if random.randint (1, rate_of_attack) == 1:  
            attack_number -= 1  
            c = city_list [random.randint (0, 5)]  
            createMissile ([random.randint (1, 1000), 0],  
                           c._epicenter)
```

## Linking up guns to the game

```
if random.randint (1, rate_of_attack) == 1:
    attack_number -= 1
    g = gun_list [random.randint (0, 2)]
    createMissile ([random.randint (1, 1000), 0],
                   g._epicenter)
```

## Linking up guns to the game

```
def make_guns ():  
    global gun_list  
    for p in silos:  
        g = gun (p)  
        gun_list += [g]
```

## Linking up guns to the game

```
def main ():  
    global screen  
    pygame.init ()  
    screen = pygame.display.set_mode ([width, height])  
    make_cities ()  
    make_guns ()  
    wait_for_event ()
```

## Tutorial

- add this code to your game
- comment the code
- observe the similarity between guns and cities
- add scoring, sounds and features
