Lecture: 14-1

Prerequisites for this lecture are: 13-1, 13-2 and 13-3.

Overview of TouchGUI

- documentation (http://floppsie.comp.glam.ac.uk/
 touchgui/homepage.html)
- you can obtain a copy of the source code for touchgui by:
- \$ cd \$ mkdir -p Sandpit \$ cd Sandpit \$ git clone https://github.com/gaiusm/touchgui

Overview of TouchGUI

- touchgui is a simple tablet based gui for Python/Pygame
 - it allows tiles to be created from images, colours or glyphs
 - each tile has a number of callbacks which are called whenever a tap or double tap occurs

Overview of TouchGUI

- a tile maybe in one of the following four states: images for the tile when in the frozen, active, activated or pressed state
 - the frozen state is when the tile cannot be pressed
 - (the application might choose to disable the tile)
- the active state is when the tile can be pressed by the user
 - the activated state is when the mouse pointer is hovering over the tile (but not pressed)
 - finally the pressed state is when the button is tapped.

- touchgui is installed in the images
- when running touchmap you need to explicitly alter the PYTHONPATH
 - so that the build directory can access the source directory for python libraries
- you can do this on the command line and run your touchmap by:
 - (this assumes you have already downloaded and configured touchmap from previous weeks)

- \$ cd \$ cd Sandpit/build-touchmap \$ PYTHONPATH=.:../touchmap-0.1:../touchgui python3 ../touchmap-0.1/touchmap.py
- the PYTHONPATH environment variable is set to search the current directory (the first .)
 - then search ../touchmap-0.1 and lastly search ../touchgui for any python modules (before searching the system installed libraries)
 - \blacksquare note the path separator:
- after setting the PYTHONPATH the python interpreter is executed which inherits this PYTHONPATH and starts interpreting
 - ../touchmap-0.1/touchmap.py

- you can use
- \$ cd \$HOME/Sandpit/build-touchmap
 - \$./localrun.sh touchmap.py

instead

- using a suitable file manager examine the contents of touchgui
- in particular examine the library of creative common images
- maybe make a note of icons you might find useful for your touchmap implementation
