Lecture: 7-3

Prerequisites for this lecture are: 7-1 and 7-2.

Homework and tutorial work

- comment the code found in 7-2
- use this module bres.py together with the explosions.py code we looked at last week to generate explosions and track the mouse
- declare a missile class which can be given two points: start, end to traverse along a chosen path
- introduce an update method for the missile class which moves the missile onto the next coordinate
- tie these pieces together and allow the mouse to fire off a missile from the left, middle, and right silos
