Sprites and collisions

- you will need to save these images in the same directory as the code:
  - gun.png ⟨ball.png⟩
  - arrow.png ⟨ball.png⟩
  - ball.png ⟨ball.png⟩

Sprites and collisions

- sprites are created and normally placed into a list
  - and referred to as a group

- you can then test for a collision between another sprite via:

```
inter = spritecollide(foo, bar, dokill)
```

- `inter` is a list of all sprites from list `bar` which have collided with the single sprite `foo`

- the `dokill` parameter is either `True` or `False` and if it was `True` the the `kill` method is called for every sprite in the list `inter`

Sprites and collisions

■
```
for bomb in sprite.spritecollide(player, bombs, True):
    boom_sound.play()
```

■ notice that this example tests whether a single sprite `player` has collided with any sprite in the `bombs` list

Managing collisions between two groups of sprites

■ we can detect whether a collision occurs between two groups of sprites by using the following function:

■
```
groupcollide(list1, list2, dokill1, dokill2)
```

■ this function returns a dictionary
  ■ each key in the dictionary is a sprite in `list1` and its value is a list of sprites from `list2` with which it has collided
  ■ the `dokill1`, `dokill2` arguments determine whether the `kill` method should be called in `list1` or `list2`

Managing collisions between two groups of sprites

■
```
for alien in sprite.groupcollide(aliens, bullets, True, True).keys()
    boom_sound.play()
    kills += 1
```

■ the code checks for the collisions between bullets and all the aliens

■ in this case we only loop over the dictionary keys
   ■ but we could loop over the `values()` or `items()`
   ■ if we wanted to do something to the specific shots that collided with aliens

Managing collisions between two groups of sprites

■ if we did loop over the `values()` we would be looping through lists that contain sprites

■ note that the same sprite may even appear more than once in these different loops, since the same `bullet` could have collided against multiple `aliens`

Real example

- *"Talk is cheap. Show me the code."*

         delay = len(invaders)

pygame.time.delay(50)
print "winner"
```

Tutorial

- extend your missile command program to include a `city` class

- give your city class an `__init__`, `update`, `ignite`, `erase` and `check` method

- the method prototypes are:

Tutorial

-
```
      # create a city at pos
      # calculcate the epicenter of the city
      # store it in the class
      def __init__ (self, pos):
      # draw the city
      def draw_city (self):
      # remove the city
      def erase (self):
      # determine whether city should catch fire given exposion at p with a radius
      def check (self, p, radius):
```

- extend your game to include cities and their destuction!

- now create a `gun` class (which will be very similar to the city class)
